Information Systems in Business Today

VIDEO CASES
Case 1: UPS Global Operations with the DIAD IV
Case 2: Google Data Center Efficiency Best Practices
Instructional Video 1: Green Energy Efficiency in a Data Center Using Tivoli Architecture
Instructional Video 2: Tour IBM’s Raleigh Data Center

Learning Objectives
• How are information systems transforming business, and why are they so essential for running and managing a business today?
• What is an information system? How does it work? What are its management, organization, and technology components? Why are complementary assets essential for ensuring that information systems provide genuine value for organizations?
• What academic disciplines are used to study information systems and how does each contribute to an understanding of information systems?

Problem: Improving fan attendance and minimizing lost revenue when season ticket-holders don’t attend.

Solutions:
– Enhance customer satisfaction by offering Wi-Fi access and game-related information services.
– Provide marketplace for ticketholders to resell tickets.
– Enable dynamic pricing to sell more tickets.

The SF Giants Win Big with Information Technology

San Francisco Giants/AT&T Stadium uses Fieldf/x to improve team decision making, Qcue to provide dynamic ticket pricing, and wireless technology to provide services for fans.

• Demonstrates IT’s role in increasing value and revenue in any business.
• Illustrates the potential for technology to improve customer experience.
• How information systems are transforming business
  – Emerging mobile digital platform
  – Growing business use of “big data”
  – Growth in cloud computing
• Globalization opportunities
  – Internet has drastically reduced costs of operating on global scale
  – Increases in foreign trade, outsourcing
  – Presents both challenges and opportunities

Information Technology Capital Investment

FIGURE 1-1

Interactive Session: Management

• What kinds of applications are described in the case? What business functions do they support? How do they improve operational efficiency and decision making?
• Identify the problems that businesses in this case study solved by using mobile digital devices.
• What kinds of businesses are most likely to benefit from equipping their employees with mobile devices?
• Discuss the implications of this statement: “The iPhone is not a game changer, it’s an industry changer.”

MEET THE NEW MOBILE WORKERS

• In the emerging, fully digital firm:
  – Significant business relationships are digitally enabled and mediated.
  – Core business processes are accomplished through digital networks.
  – Key corporate assets are managed digitally.
• Digital firms offer greater flexibility in organization and management.
  – Time shifting, space shifting
• Growing interdependence between:
  – Ability to use information technology and
  – Ability to implement corporate strategies and achieve corporate goals

• Firms invest heavily in information systems to achieve six strategic business objectives:
  1. Operational excellence
  2. New products, services, and business models
  3. Customer and supplier intimacy
  4. Improved decision making
  5. Competitive advantage
  6. Survival

In contemporary systems there is a growing interdependence between a firm’s information systems and its business capabilities. Changes in strategy, rules, and business processes increasingly require changes in hardware, software, databases, and telecommunications. Often, what the organization would like to do depends on what its systems will permit it to do.

Operational excellence:
  – Improvement of efficiency to attain higher profitability
  – Information systems, technology an important tool in achieving greater efficiency and productivity
  – Walmart’s Retail Link system links suppliers to stores for superior replenishment system
• New products, services, and business models:
  – Business model: describes how company produces, delivers, and sells product or service to create wealth
  – Information systems and technology a major enabling tool for new products, services, business models
    • Examples: Apple’s iPad, Google’s Android OS, and Netflix

• Customer and supplier intimacy:
  – Serving customers well leads to customers returning, which raises revenues and profits.
    • Example: High-end hotels that use computers to track customer preferences and used to monitor and customize environment
  – Intimacy with suppliers allows them to provide vital inputs, which lowers costs.
    • Example: JCPenney’s information system which links sales records to contract manufacturer

• Improved decision making
  – Without accurate information:
    • Managers must use forecasts, best guesses, luck
    • Results in:
      – Overproduction, underproduction
      – Misallocation of resources
      – Poor response times
    • Poor outcomes raise costs, lose customers
  – Example: Verizon’s Web-based digital dashboard to provide managers with real-time data on customer complaints, network performance, line outages, and so on

• Competitive advantage
  – Delivering better performance
  – Charging less for superior products
  – Responding to customers and suppliers in real time
  – Examples: Apple, Walmart, UPS
• Survival
  – Information technologies as necessity of business
  – Industry-level changes
    • Example: Citibank’s introduction of ATMs
  – Governmental regulations requiring record-keeping
    • Examples: Toxic Substances Control Act, Sarbanes-Oxley Act
    • Dodd-Frank Act

• Information system:
  – Set of interrelated components
  – Collect, process, store, and distribute information
  – Support decision making, coordination, and control

• Information vs. data
  – Data are streams of raw facts.
  – Information is data shaped into meaningful form.

What Is an Information System?

Three activities of information systems produce information organizations need

• Input: Captures raw data from organization or external environment
• Processing: Converts raw data into meaningful form
• Output: Transfers processed information to people or activities that use it
Feedback:
- Output is returned to appropriate members of organization to help evaluate or correct input stage.

Computer/computer program vs. information system
- Computers and software are technical foundation and tools, similar to the material and tools used to build a house.

An information system contains information about an organization and its environment. These basic activities—input, processing, and output—produce the information organizations need. Feedback is output returned to appropriate people or activities in the organization to evaluate and refine the input. Environmental factors, such as customers, suppliers, competitors, stockholders, and regulatory agencies, interact with the organization and its information systems.

Functions of an Information System
- Senior management
- Middle management
- Operational management
- Knowledge workers
- Data workers
- Production or service workers
Business organizations are hierarchies consisting of three principal levels: senior management, middle management, and operational management. Information systems serve each of these levels. Scientists and knowledge workers often work with middle management.

**Figure 1.6** Levels in a Firm

**What Is an Information System?**

- **Organizational dimension of information systems (cont.)**
  - Separation of business functions
    - Sales and marketing
    - Human resources
    - Finance and accounting
    - Manufacturing and production
  - Unique business processes
  - Unique business culture
  - Organizational politics

- **Management dimension of information systems**
  - Managers set organizational strategy for responding to business challenges
  - In addition, managers must act creatively:
    - Creation of new products and services
    - Occasionally re-creating the organization

- **Technology dimension of information systems**
  - Computer hardware and software
  - Data management technology
  - Networking and telecommunications technology
    - Networks, the Internet, intranets and extranets, World Wide Web
  - IT infrastructure: provides platform that system is built on
Interactive Session: Organizations

• What are the inputs, processing, and outputs of UPS’s package tracking system?
• What technologies are used by UPS? How are these technologies related to UPS’s business strategy?
• What business objectives do UPS’s information systems address?
• What would happen if these systems were not available?

Dimensions of UPS tracking system
– Organizational:
  • Procedures for tracking packages and managing inventory and provide information
– Management:
  • Monitor service levels and costs
– Technology:
  • Handheld computers, bar-code scanners, networks, desktop computers, and so on

What Is an Information System?

• Business perspective on information systems:
  – Information system is instrument for creating value
  – Investments in information technology will result in superior returns:
    • Productivity increases
    • Revenue increases
    • Superior long-term strategic positioning

• Business information value chain
  – Raw data acquired and transformed through stages that add value to that information
  – Value of information system determined in part by extent to which it leads to better decisions, greater efficiency, and higher profits

• Business perspective:
  – Calls attention to organizational and managerial nature of information systems
From a business perspective, information systems are part of a series of value-adding activities for acquiring, transforming, and distributing information that managers can use to capture decision-making, influence organizational performance, and, ultimately, increase firm profitability.

- Investing in information technology does not guarantee good returns.
- There is considerable variation in the returns firms receive from systems investments.
- Factors:
  - Adopting the right business model
  - Investing in complementary assets (organizational and management capital)

Although, on average, investments in information technology produce returns far above those obtained by other investments, there is considerable variation across firms.

- Complementary assets:
  - Assets required to derive value from a primary investment
  - Firms supporting technology investments with investment in complementary assets receive superior returns
  - Example: Invest in technology and the people to make it work properly
• Complementary assets include:
  – Organizational assets, for example:
    • Appropriate business model
    • Efficient business processes
  – Managerial assets, for example:
    • Incentives for management innovation
    • Teamwork and collaborative work environments
  – Social assets, for example:
    • The Internet and telecommunications infrastructure
    • Technology standards

What Is an Information System?
The study of information systems deals with issues and insights contributed from technical and behavioral disciplines.

Technical approach
  – Emphasizes mathematically based models
  – Computer science, management science, operations research

Behavioral approach
  – Behavioral issues (strategic business integration, implementation, etc.)
  – Psychology, economics, sociology

Management Information Systems
Combines computer science, management science, operations research, and practical orientation with behavioral issues

Four main actors
  – Suppliers of hardware and software
  – Business firms
  – Managers and employees
  – Firm’s environment (legal, social, cultural context)
• Approach of this book: Sociotechnical view
  – Optimal organizational performance achieved by jointly optimizing both social and technical systems used in production
  – Helps avoid purely technological approach

In a sociotechnical perspective, the performance of a system is optimized when both the technology and the organization mutually adjust to each other until a satisfactory fit is obtained.
